EXPERIMENT

Title

DIWALI CONTEST

Description

Max is planning to take part in a Diwali contest at a Diwali Party that will begin at 8 PM and will run until midnight (12 AM) i.e., for 4 hours. He also needs to travel to the party venue within this time which takes him **P** minutes. The contest comprises of **N** problems that are arranged in order of difficulty, with problem 1 being the simplest and problem N being the most difficult. Max is aware that he will require $5 \times i$ minutes to solve the i^{th} problem.

Your task is help Max find and return an integer value, representing the number of problems Max can solve and reach the party venue within the given time frame of 4 hours.

Note: Max will leave his home at exactly 8 PM to reach the party venue.

Input Format:

input1: An integer value N, representing the total number of problems.

input2: An integer value P, Representing the time to travel in minutes from his home to the party venue.

Example:

Input:

6

180

Output:

4

Explanation:

The amount of time left to solve the problems is $4 \times 60 - 180 = 60$ mins.

1st Problem - 5 mins, Time left = $60 - 5 = 55$ mins

2nd Problem - 10 mins, Time left = $55 - 10 = 45$ mins

3rd Problem - 15 mins, Time left = $45 - 15 = 30$ mins

4th Problem - 20 mins, Time left = $30 - 20 = 10$ mins

5th Problem - 25 mins

So he can solve only 4 problems as he is not left with 25 mins to complete 5th problem.

Source Code:

```
N=int(input())
L=list(map(int,input().split()))
A=0
for i in L:
    if(i==0):
        A+=0
    elif(i<0):
        A+=1
    else:
        if(i%3==0):
            A+=i//3
        else:
            A+=(i//3+1)
print(A)
```
